## CULTIVATION HINTS

**Naturalizing Daffodils and Narcissi in Grass etc.** Most Daffodils and Narcissi are suitable for naturalizing but in very heavy soils, preference should be given to stronger growing kinds e.g. Trumpet varieties and many Large-Cupped. They are all admirably adaptable for grassy slopes and banks, where they should be freely planted. A splendid effect is obtained when Trumpet and other varieties are grouped separately, scattered on the ground and planted where they fall.

**Growing Daffodils in the greenhouse or indoors.** Many Daffodils and Narcissi are suitable for this purpose some varieties responding better than others to forcing. Pot up the bulbs on arrival and if ordinary pots are used take a good loamy soil, adding sufficient sand and peat to keep the mixture open. A light dusting of bone meal is also useful. Pot firmly in well-crooked pots. For bowls without drainage holes use a good fibre. Plunge the pots and/or bowls in the coolest place of your garden and in the absence of garden space the pots may be placed in a cool cellar (35-40°F) where watering from time to time is necessary. When the shoots are about 4 inches long and the flower buds well out of the neck of the bulbs, the pots may be removed into a warm room. Heat should be gradually increased from 50° to max. 60°F. It is advisable to remove the foliage of the side-shoots, if these do not show a flower bud. Just before the buds are open, water should be sprayed lightly over the buds, when they are in bloom less water should be applied.

6108 \$3.00/10; \$13.00/50; \$24.00/100

**Soil and its Treatment.** Daffodils and Narcissi will thrive in any well-cultivated and well-drained garden soil. In preparing the ground for planting, dig deeply and if well-rotted stable or cow manure is available this may advantageously be worked in 10 to 16 inches deep so as not to come into immediate contact with the bulbs. Never use fresh manure of any kind at planting time. On poor and dry sandy soils we recommend a dressing of bone meal at a rate of about 1 oz. per square yard to be sprinkled over the surface of the ground after planting.
