Viridiflora Tulips (Green Tulips)

Many visitors to our Flowershow Exhibits were delighted about the delicate elegance of these Tulips and therefore the 'green' viridiflora Tulips have been separately listed. The green structure of the flower petals enable these varieties to stand all weather conditions extremely well.

Daffodils and Narcissi

The beauty of Daffodils and Narcissi is unquestioned and these flowers now form a leading feature in almost every spring garden. Every gardener should realize the enormous amount of intense pleasure that can so easily be obtained from the cultivation of a batch of Daffodils or Narcissi.

Naturalizing Daffodils and Narcissi in Grass etc. All Daffodils and Narcissi are suitable for naturalizing but in very heavy soils, preference should be given to stronger growing sorts e.i. Trumpet varieties and many Large Cupped sorts. They are all admirably adaptable for grassy slopes and banks, where they should be freely planted. A splendid effect is obtained when Trumpet and other varieties are grouped separately, scattered on the ground and planted where they fall.

Soil and its Treatment. Daffodils and Narcissi will thrive in any well cultivated and drained garden soil. In preparing the ground for planting, dig deeply and if well rotted stable or cow manure is available this may advantageously be dug in 18 to 20 inches deep so as not to come into immediate contact with the bulbs. Never use fresh manure of any kind at planting time. On poor and dry sandy soils we recommend a dressing of sulphate of potash at a rate of about 1 oz. per square yard to be sprinkled over the surface of the ground after planting.

Growing Daffodils in the greenhouse or indoors. All types of Daffodils and Narcissi are suitable for this purpose. Pot up the bulbs on arrival and if ordinary pots are used take a good loamy soil, adding sufficient sand and peat to keep the mixture open. A light dusting of bone meal is also useful. Pot firmly in well crocked pots. For bowls without drainage holes use a good fibre. Plunge the pots and/or bowls in the coolest place of your garden and in the absence of garden space the pots may be placed in a cool cellar (35–40° F.) where watering from time to time is necessary. When the shoots are about 4 inches long and the flower buds well out of the neck of the bulbs, the pots may be removed into a warm room. Heat should be gradually increased from 50° to max. 60° F.

It is advisable to remove the foliage of the sideshoots, if these do not show a flower bud. Just before the buds are open water lightly, when they are in bloom less water should be applied.

1956 BALLOT OF DAFFODIL VARIETIES FOR EXHIBITION FROM EACH DIVISION

Each year, on the occasion of the great Daffodil Show of the Royal Horticultural Society, London, England, twenty-seven daffodil experts take part in ballots of Daffodil varieties suitable for a particular purpose. We thought it to be a good idea to re-print the 1956 ballot of the best Varieties for Exhibition from each Division, while this may be of special interest to those who take part in Daffodil Competition Shows. All these varieties are also most suitable for the garden.

Hyacinths

The best hand-picked quality, choice bulbs selected from healthy stocks, adapted for Bowls, Pots, Glasses and for Exhibition. We include only valuable varieties in our Collections.

CULTURE IN POTS

Hyacinths should be potted early in September for Christmas flowering and every fortnight thereafter for succession. Plunge pots in the coolest place of the garden, or place in a dark, cool cellar. After three or four months, remove to the forcing house as required, but care should always be taken that the bulbs are well rooted and the buds well out of the neck of the bulbs before beginning to force, as successful cultivation depends almost completely on these points. To keep the foliage dwarf and to assist the perfect colouring of the flowers, they should have occasionally a supply of liquid manure during the growing period. Always use clean old pots.

HYACINTHS ON GLASSES

This old fashioned way is in favour again now that the proper glasses are on the market. Fill the glass with water (rainwater preferred) almost to touch the base of the bulbs. A few pieces of charcoal should be put in the glass, as this keeps the water clean. The next procedure is the simple one of placing the glasses in any dark cool room, cellar or cupboard until the sprouts are about 3 inches high, then they may be brought gradually to the full light. Although this system of culture is very simple, it is of the first importance that the largest size bulbs are obtained.

OUTDOOR CULTURE

For successful cultivation in the open air, Hyacinths may be planted any time from September to December. September and October are the best months; they like a light rich soil, the ground should be well drained. Plant the bulbs at equal distances apart in circles or in straight lines and about 5 inches deep. Never plant the bulbs when the ground is wet. They require a little covering of straw or a thin layer of leaves during the winter to protect them from frost.
