

Parts of a Daffodil Plant

root – absorbs water and minerals from the soil

bulb – stores food

leaf – makes food for the plant

stem – holds up the flower and carries water and food throughout the plant

flower – contains the parts of the plant that can produce more seed to make a new plant

Parts of a Daffodil Flower

cup – trumpet shaped inner growth of the flower

perianth – six floral segments around the cup

stamen – six male parts of the plant

- anther – produces and releases pollen
- filament – holds up the anther

pistil – female part of the plant

- stigma – receives pollen
- style – supports the stigma and connects it to the ovary
- ovary – protects eggs which can become seeds if fertilized by pollen
