Narcissus Incomparabilis Fortune

Daffodils and Narcissi

The beauty of Daffodils and Narcissi is unquestioned and these flowers now form a leading feature in almost every spring garden. Every gardener should realize the enormous amount of intense pleasure that can so easily be obtained from the cultivation of a batch of Daffodils or Narcissi.

We advise our friends to order a small collection of the better sorts this year since such varieties as Beersheba (White Trumpet), Fortune (Incomp.), Tunis (Giant Leedsii), Therapia (Barrii), Carlton (Incomp.), Carbineer (Incomp.), John Evelyn (Incomp.), King Alfred (Yellow Trumpet) and many other choice things can be had at so much reduced prices. You will find them a good investment!

Soil and its Treatment. Daffodils and Narcissi will thrive in any well cultivated garden soil but prefer a good deep well drained loam. In preparing the ground for planting, dig deeply and if well rotted stable or cow manure is available this may advantageously be dug in 18 to 20 inches deep so as not to come into immediate contact with the bulbs. Never use fresh manure of any kind at planting time. On poor and dry sandy soils we recommend a dressing of sulphate of potash at a rate of about 1 oz. per square yard to be sprinkled over the surface of the ground after planting.

Naturalizing Daffodils and Narcissi in Grass etc. All Daffodils and Narcissi are suitable for naturalising but in heavy soils preference should be given to stronger growing sorts i.e. Trumpet varieties. They are all admirably adapted for grassy slopes and banks, where they should be freely planted. A splendid effect is obtained when Trumpet and short cupped varieties are grouped separately.

Growing Daffodils and Narcissi in the Cold Greenhouse or Indoors. It is doubtful whether many people realize the amount of intense pleasure that is obtained from the cultivation of a few fine daffodils in a cold or very slightly heated greenhouse or in a sitting room. The flowers last well, often for two or three weeks and of course the earlier and later varieties provide a succession.

Hyacinths

The best handpicked quality choice bulbs selected from healthy stocks and we recommend them with every confidence. Unless customers are very familiar with the varieties, it is much better to leave the selection to us and state only the colors and the quantities needed, when suitable bulbs will be supplied for forcing and outdoor culture.

CULTURE IN POTS

*Mix up a light rich compost of loam, leaf mould, well decayed cow manure and pure sand in equal portions, let this stand about one month before using. Hyacinths should be potted early in September for Christmas flowering and every fortnight after for succession.

In potting leave the top of the bulbs level with the surface of the soil, which should be moderately moist and be pressed firmly; place a little clean sand round the base of the bulb. When potted place on a bed of ashes and cover with cocoanut fibre refuse to a depth of about 5 inches; after three or four months, when well rooted, remove to the forcing house as required but care should always be taken that the bulbs are well rooted before beginning to force, as successful cultivation depends almost completely on this point. To keep the foliage dwarf and to assist the perfect coloring of the flowers, when growing, they should have occasionally a supply of liquid manure. Always use clean old pots or pans.

HYACINTHS IN GLASSES

Fill the glass with water (rainwater preferred) so as almost to touch the base of the bulbs a few pieces of charcoal should be put in the glass, as this is of service in keeping the water pure. The next proceeding is the simple one of placing the glasses in any dark room, cellar or cupboard for about four weeks, until the roots nearly touch the bottom of the glass, when they may be brought gradually to the full light. We only recommend Single varieties for this purpose. Although this system of culture is very simple, it is of the first importance that suitable bulbs be obtained.
